Q

SQL RIGHT JOIN Palabra clave

Anterior

A continuación?

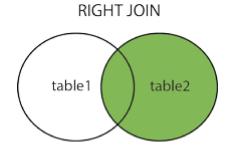

SQL RIGHT JOIN Palabra clave

La palabra clave RIGHT JOIN devuelve todos los registros de la tabla derecha (tabla2) y los registros coincidentes de la tabla izquierda (tabla1). El resultado es NULL desde el lado izquierdo, cuando no hay ninguna coincidencia.

Sintaxis RIGHT JOIN

```
SELECT column_name(s)
FROM table1
RIGHT JOIN table2
ON table1.column_name = table2.column_name;
```

Nota: En algunas bases de datos RIGHT JOIN se llama RIGHT OUTER JOIN.

Base de datos de demostración

En este tutorial usaremos la conocida base de datos de ejemplo Northwind.

A continuación se muestra una selección de la tabla "Pedidos":

OrderID	CustomerID	EmployeeID	OrderDate	ShipperID
10308	2	7	1996-09-18	3
10309	37	3	1996-09-19	1
10310	77	8	1996-09-20	2

Y una selección de la tabla "Empleados":

EmployeeID	LastName	FirstName	BirthDate	Photo
1	Davolio	Nancy	12/8/1968	EmpID1.pic
2	Fuller	Andrew	2/19/1952	EmpID2.pic
3	Leverling	Janet	8/30/1963	EmpID3.pic

Ejemplo de unión de SQL RIGHT

La siguiente instrucción SQL devolverá todos los empleados y cualquier pedido que hayan realizado:

Ejemplo

```
SELECT Orders.OrderID, Employees.LastName, Employees.FirstName
FROM Orders
RIGHT JOIN Employees ON Orders.EmployeeID = Employees.EmployeeID
ORDER BY Orders.OrderID;
```

Pruébelo usted mismo »

Note: The RIGHT JOIN keyword returns all records from the right table (Employees), even if there are no matches in the left table (Orders).

Test Yourself With Exercises

Exercise:

Choose the correct clause to select all the records from the table plus all the matches in the table. JOIN Customers Orders

SELECT *

FROM Orders

ON Orders.CustomerID=Customers.CustomerID;
